Check the weather on Terminal !

What you can do in AccuWeather application

```ruby
rest_accuweather_service.rb ✕

weather_terminal_app > src > lib > 🔴 rest_accuweather_service.rb
 1    require 'singleton'
 2    require 'rest-client'
 3
 4    class RestAccuweatherService
 5        include Singleton
 6
 7        def initialize
 8            @accuweather_key = File.read("../res/accuweather_key.db")
 9        end
10
11        def self._load(str)
12            instance.keep = Marshal.load(str)
13            instance
14        end
15
16        def get_location(location)
17            str_get = "http://dataservice.accuweather.com/locations/v1/search?apikey=#{@accuweather_key}&q=#{location}"
18            return  RestClient.get(str_get)
19        end
20
21        def get_weather_info(location_key)
22            str_get = "http://dataservice.accuweather.com/forecasts/v1/daily/5day/#{location_key}?apikey=#{@accuweather_key}"
23            return RestClient.get(str_get)
24        end
25    end
```

- RestAccuweatherServie class runs as a Singleton and call the REST API to get the information of location and the weather information.
